New European Wind Atlas (NEWA)

Initial extension of the European domain for the New European Wind Atlas and location of high fidelity experiments

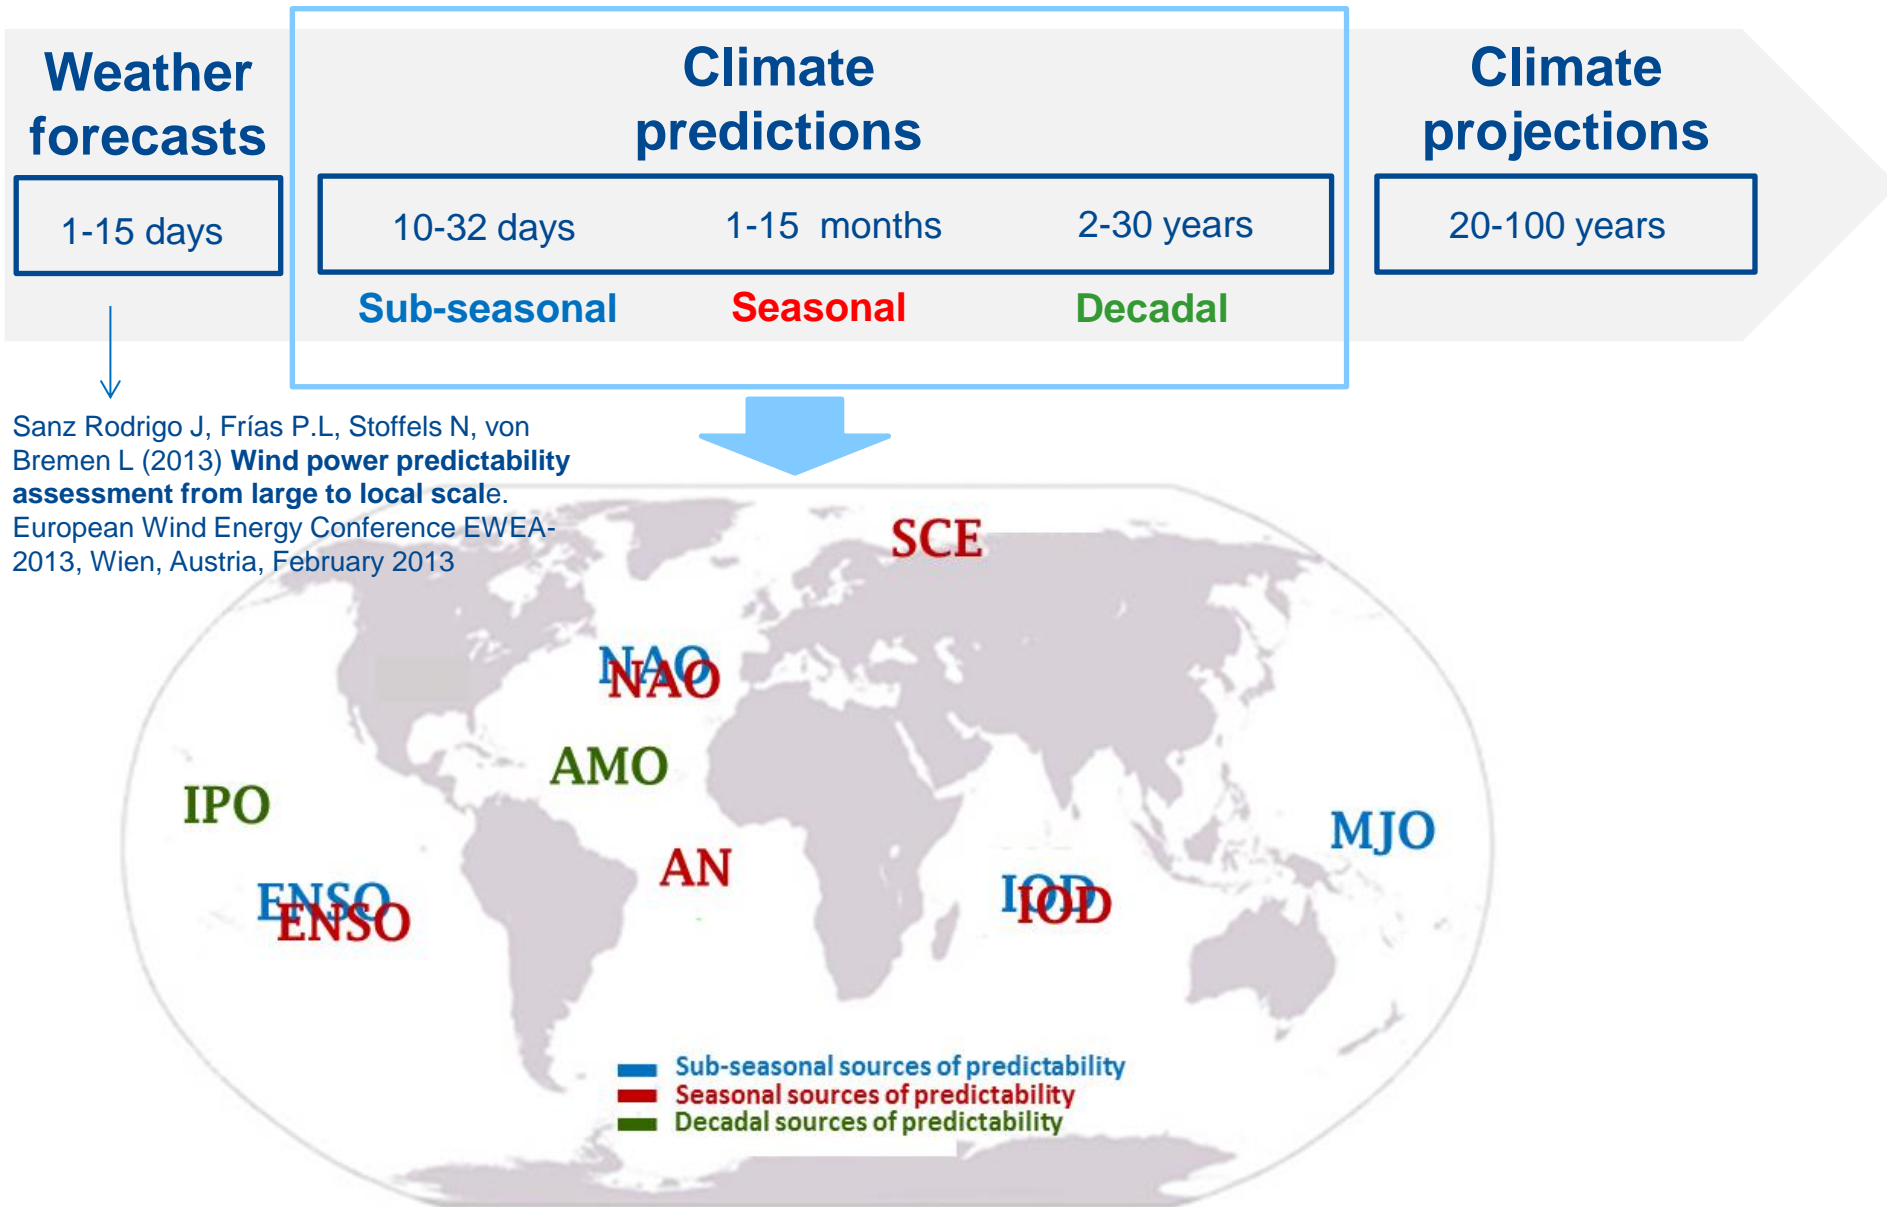

Objective: Creation and publication of a **high-resolution dataset** of wind conditions in Europe to be used as a key tool for the wind energy sector.

- Wind resource information
- Site suitability conditions
- Wind predictability

Task 3.2 (Earth Sciences Department (BSC) - CENER): Development of information about wind predictability at different time horizons.

Wind predictability at different time horizons

Data description

Variable	10-m wind speed
Target season	Winter (December- January- February)
Climate prediction systems	<ul style="list-style-type: none">• Sub-Seasonal : ECMWF Monthly Prediction System, NCEP Ensemble and CMA model• Seasonal : ECMWF System 4, MF System 4, GloSea5
Reanalyses	ERA-Interim, MERRA-2 , JRA-55
Verification measures	<ul style="list-style-type: none">• Correlation• RPSS (Ranked Probability Skill Score)

Predictability assessment of near-surface wind speed

```
graph TD; A[Predictability assessment of near-surface wind speed] --> B[Skill evolution with the lead time]; A --> C[Predictability from NAO and ENSO]
```

Skill evolution with the lead time

Predictability from NAO and ENSO

Predictability assessment of near-surface wind speed

Skill evolution with the lead time

Predictability from NAO and ENSO

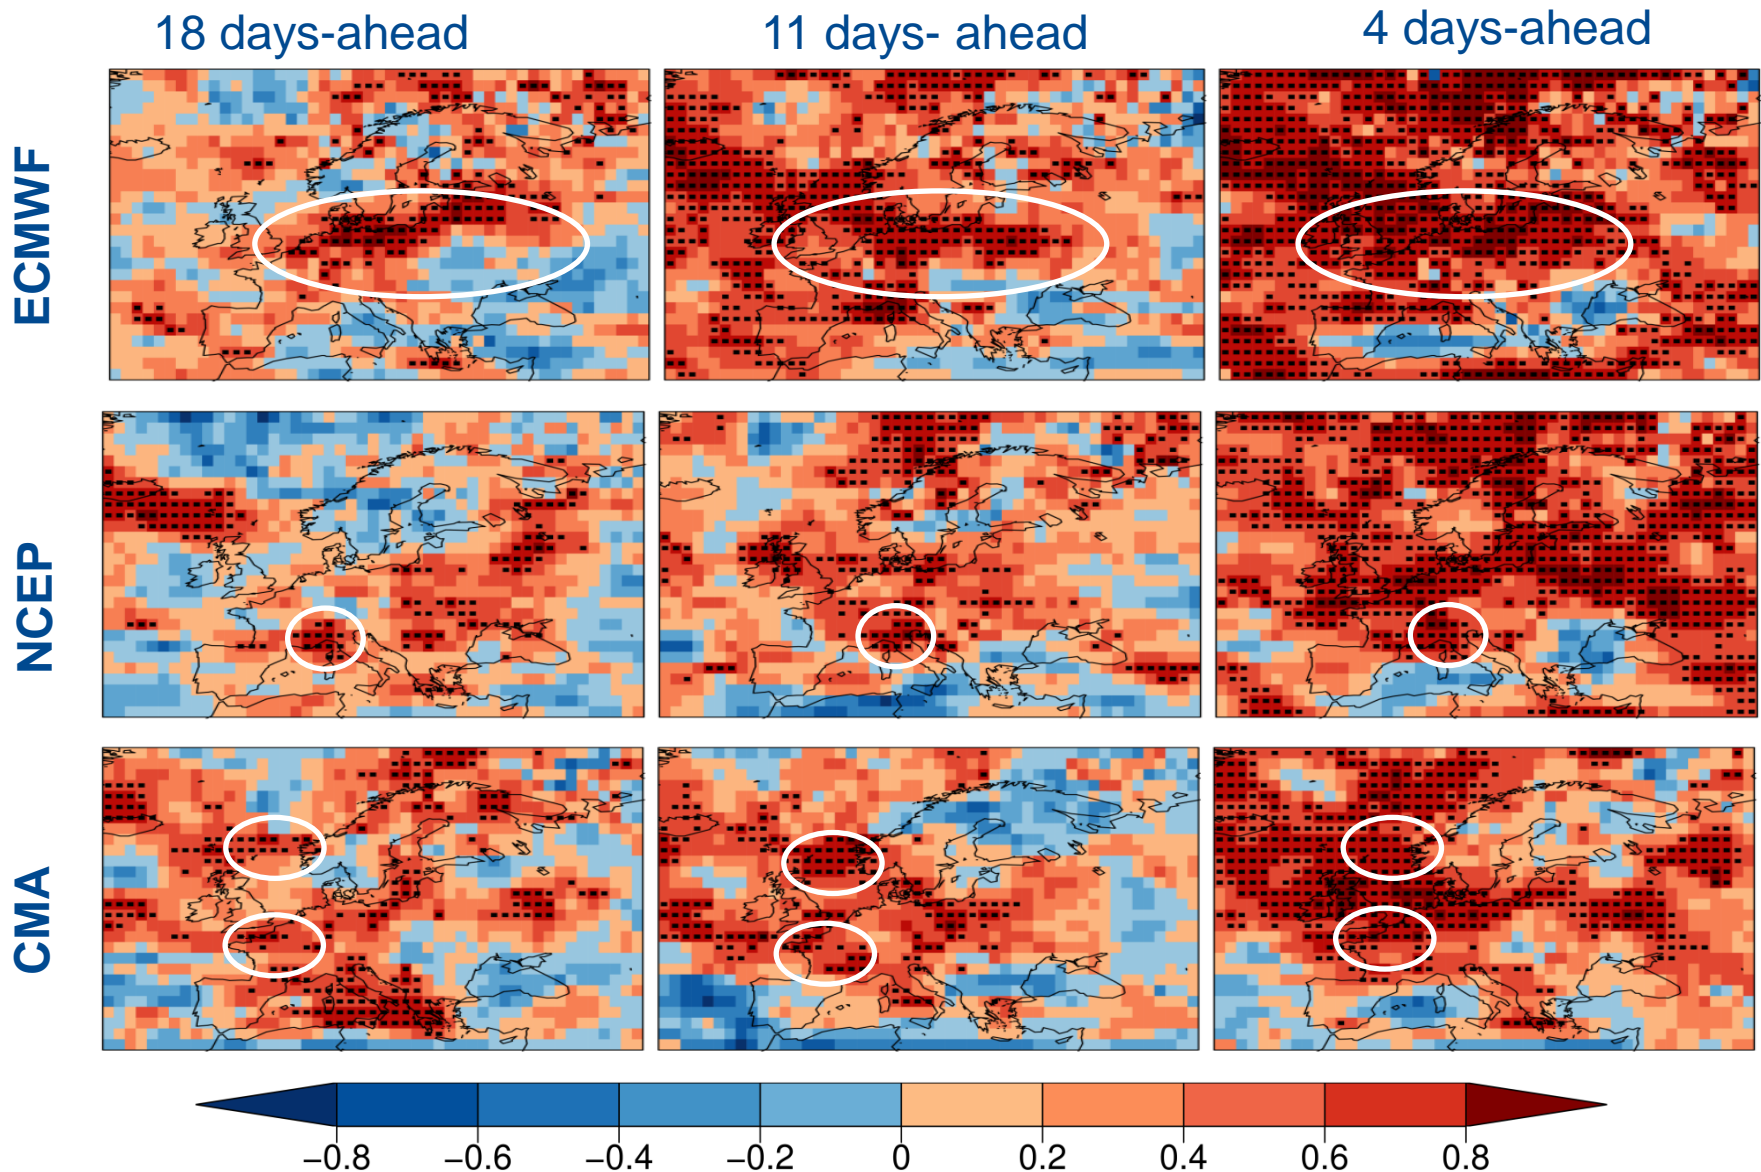

Sub-seasonal time-scales

Comparison of the predictability of 10-m
wind speed in different prediction systems.

Sub-seasonal predictability in Europe

Correlation

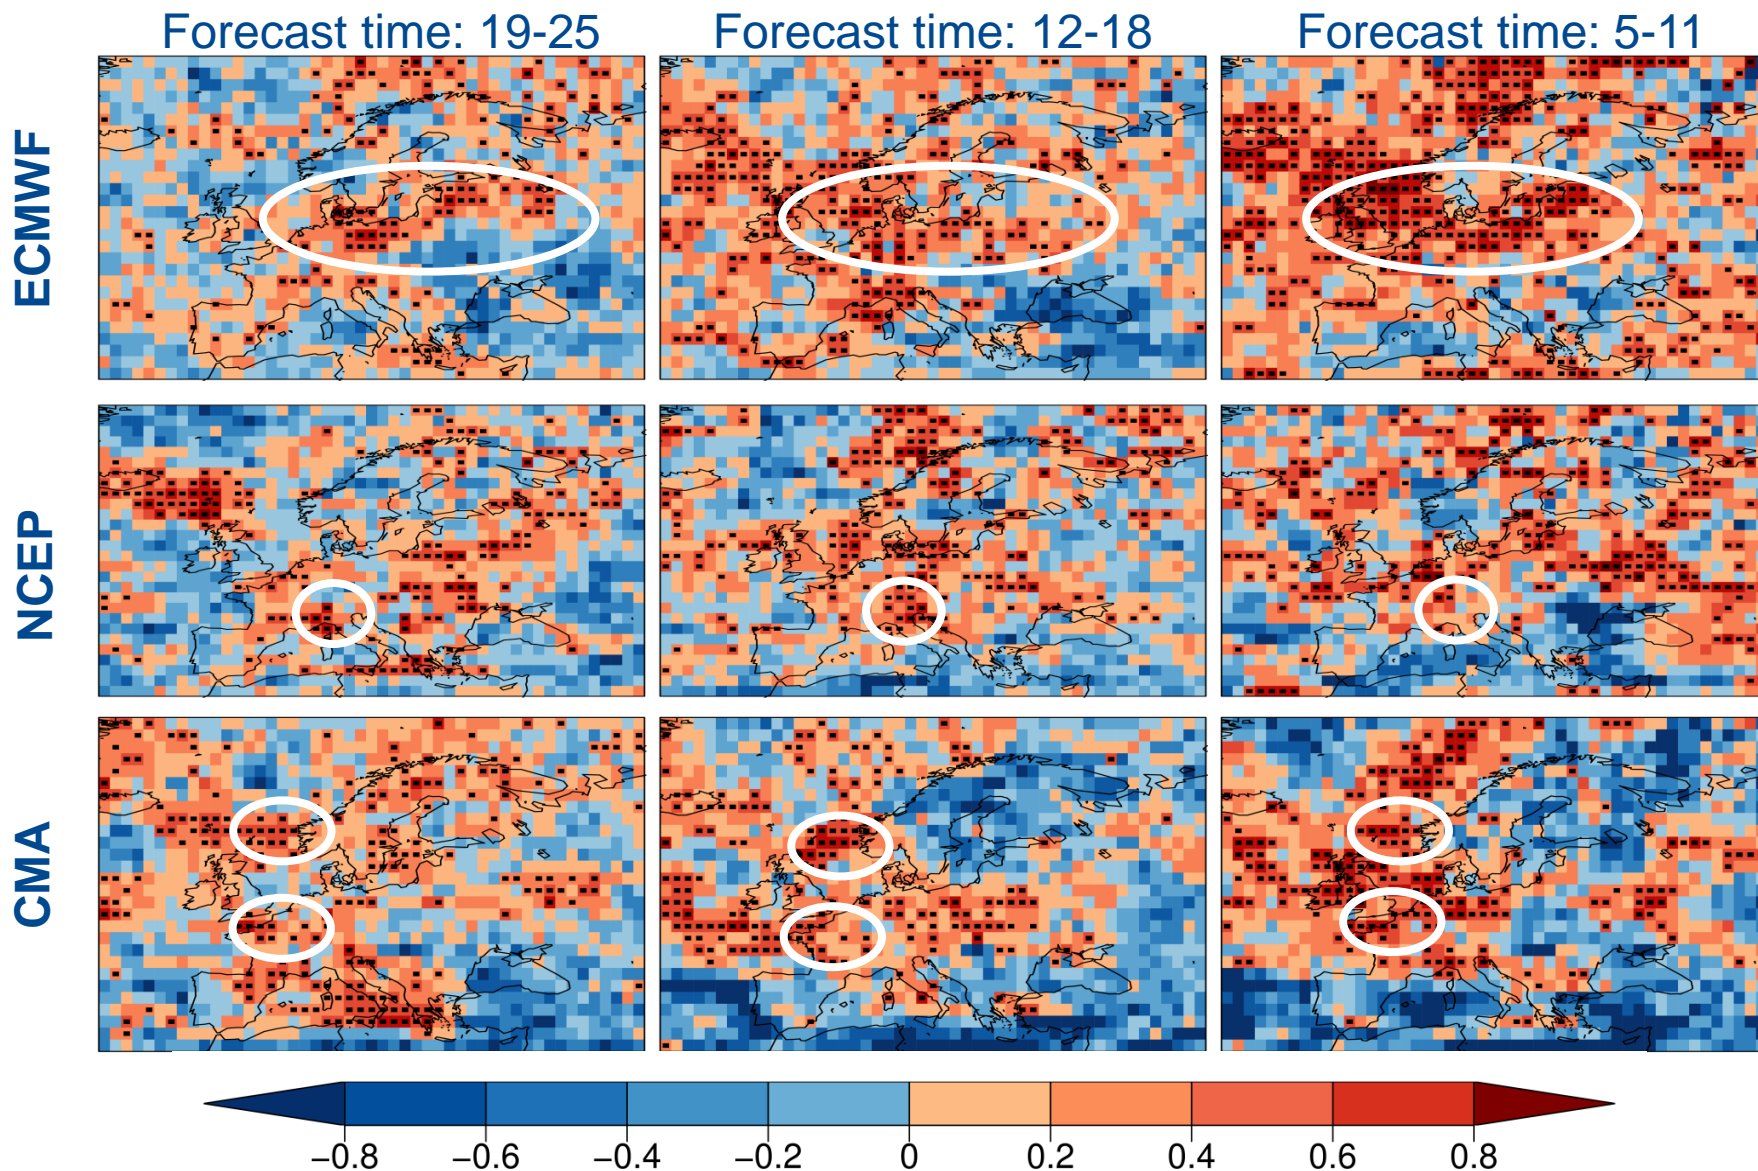

Target: Week 2nd – 8th February 2015

Sub-seasonal predictability in Europe

RPSS

Target: Week 2nd – 8th February 2015

Predictability assessment of near-surface wind speed

Skill evolution with the lead time

Predictability from NAO and ENSO

Sub-seasonal time-scales

Comparison of the predictability of 10-m
wind speed in different prediction systems.

Seasonal time-scales

Analysis in European region and
in specific locations.

Seasonal predictability in Europe

ECMWF System 4

Methodology of the predictability assessment

Predictability assessment of near-surface wind speed

Skill evolution with the lead time

Sub-seasonal time-scales

Comparison of the predictability of 10-m wind speed in different prediction systems.

Seasonal time-scales

Analysis in European regions and in specific locations.

Predictability from NAO and ENSO

Impact maps

Evaluation of the relationship between modes of variability and wind speed

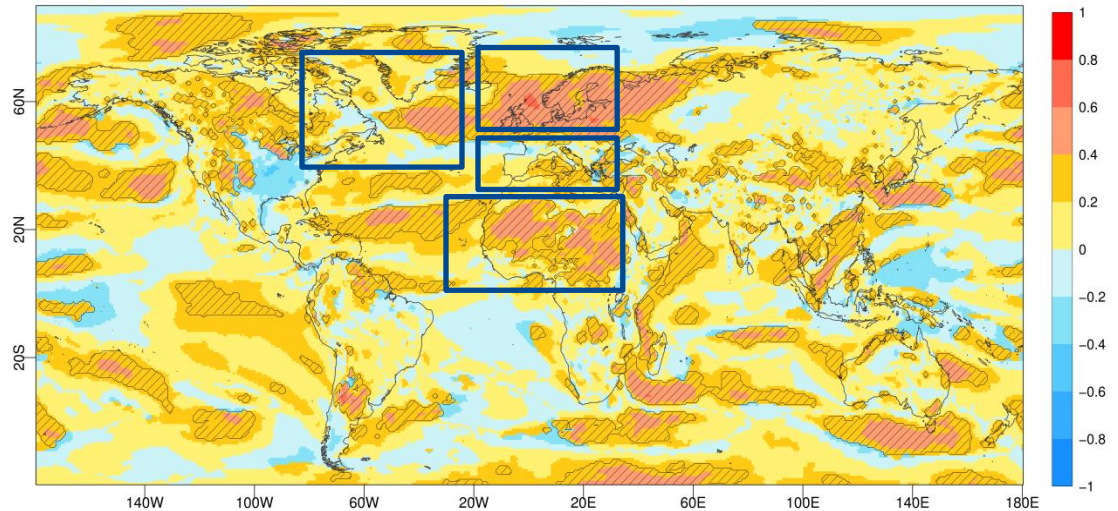

Reconstructed wind speed

A linear model has been developed to predict 10-m wind speed based on NAO

NAO seasonal forecasts

- 1) Construction of linear model based on ERA-Interim (NAO, 10-m wind speed)
- 2) NAO seasonal prediction (PC-based) from S4 SLP seasonal forecasts
- 3) NAO seasonal forecast is introduced in the linear model (from step 1) to estimate 10-m wind speed seasonal predictions
- 4) Validate 10-m wind speed predictions estimated from NAO model with the direct output from S4

DJF wind correlation at lead 1 (1981–2015)
ERA-Interim vs. reconst. from NAO ECWMF System-4

DJF wind correlation at lead 1 (1981–2015)
ERA-Interim vs. ECMWF System-4

Conclusions and prospects

- This study describes the methodology to produce **predictability information** for the wind industry that can complement the model chain used to develop the New European Wind Atlas.
- Subseasonal prediction systems display **statistically significant levels of skill** for the three lead times, but the **ECMWF** Monthly Prediction System displays the best performance.
- Seasonal prediction system shows **potential skill** in some regions, however the sources of predictability need to be further explored.
- NAO has a **marked effect upon wind speed** in Europe.
- These results can enhance our confidence in the ability of the systems to predict wind speed.

Next steps

- 1) Verification against other data bases
- 2) Application of bias-correction techniques
- 3) Assessment of different forecast systems
- 4) Summarize all information in easy interpretable format

Thank you
